

# DO YOU NEED HELP VERIFYING YOUR PRODUCTS ARE LOW LEAD COMPLIANT?

## UL HAS A SOLUTION... AND NOW WITH DISCOUNTED CERTIFICATION COSTS

In the US, the Federal Reduction of Lead in Drinking Water Act was signed into law in January of 2011 and became effective in January of 2014. This Act restricts permissible levels of lead in components and products that convey water for human consumption.

Market requirements continue to evolve with an increased emphasis on verification of conformance. NSF 372 has become the de facto national consensus standard used to demonstrate a product is in compliance with the Reduction of Lead in Drinking Water Act. As a result, plumbing codes, product standards and purchasers are now specifying NSF 372.

As the new product standard and code references to NSF 372 are put into place, manufacturers of items not often thought of as plumbing products may be concerned how these requirements will impact their products.

**The answer is clear:**

Acceptance in the market is critical. Delays are costly. If you feel your products may be impacted by these new requirements, UL has a solution with our Certification service to NSF 372.

UL offers testing and certification to NSF 372 for manufacturers interested in demonstrating product compliance with low lead content requirements.
